

Soilife™

Compost

Bring Your Soil to Life!

Soilife™ is derived from a blend of organic materials processed at our two Milwaukee area compost facilities. **Soilife™** is enhanced with the beneficial microorganisms necessary for healthy plants and turf. **Soilife™** can be blended with a variety of materials to suit many landscape construction and maintenance needs.

Soil enrichment with **Soilife™** does what?

- Adds organic bulk, humus, and cation (positively charged ions) exchange to regenerate poor soils.
- Suppresses certain plant diseases and parasites.
- Increases soil nutrition content and water retention in both clay and sandy soils.
- Restores soil structure after natural soil organisms have been reduced by use of chemical fertilizers and/or stockpiled after earth moving operations.
- Reduces fertilizer requirements by at least 50 %

Note: A case study at the Country Club of Rochester New York, after 3 years using compost as topdressing the club has increased its turfs resistance to common diseases such as snow mold, brown patch, and dollar spot nearly eliminating the need for fungicide applications for such diseases.

Soilife™ compost is stringently tested throughout its entire life from raw materials, during the composting process, and batch sampling to insure consistent material load after load.

Soilife™ is tested on a continual basis while at our facility assuring proper temperature, moisture, and oxygen to produce a finished product of the highest quality. **Soilife™** is tested by an independent laboratory to certify the finished product meets or exceeds the United States Compost Council – Seal of Testing Assurance.

Soilife™ compost meets Wisconsin DNR S100 and MNDOT compost regulations.
